

We're Hiring! – Postdoctoral Scholars

Chopra chemical immunology laboratory (<http://www.chopralab.com>) at Purdue University is looking for postdoctoral fellows in immunology to identify “immune checkpoints” or “brakes” of the neuroimmune system during neurodegeneration.

We are looking for people who are self-starters, passionate, and smart individuals and will develop a project that will result in an expertise in the lab. Our lab works with different model systems in mouse, rat, and dog brains tissue to identify neuroimmune cell subtypes of microglia and peripheral microglia-like macrophages.

Students and postdoctoral fellows in our lab explore any aspect of neuroimmune biology based on the individual interest. Expertise in neurodegeneration, neuroinflammation, cellular immunology, molecular biology, using any animal model is encouraged but we are very interested in smart and passionate individuals who are not afraid to challenge the dogma in science compared to a particular experience in neuroimmunology and neuroinflammation. Graduate students in the field of immunology, neuroinflammation and neuroimmunology, who are finishing up their PhD or within one year of PhD degree award are encouraged to apply.

Please contact Gaurav Chopra (gchopra@purdue.edu) with your CV and a brief description of the research you would like to pursue as part of your postdoctoral work.
